COMPANY

PROFILE

**We have been dealing with integrated design since 1975
in the social and healthcare sector**

CSPE - The Building Design Study Center - was founded in Florence in 1975 and deals with the development of research, studies, planning and consultancy in the sector of health and social interventions.

Since 1999, the founding members have been joined by architects Giulio Felli, Corrado Lupatelli and Manola Caruso as Technical Directors.

VISION & MISSION

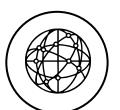

CENTER FOR STUDIES, RESEARCH AND PROJECTS FOR HEALTH

+ 50 YEARS
OF ACTIVITY

+ 150
COMPLETED PROJECTS

+ 1 MILLION MQ
PROJECTS DEVELOPED

CSPE has specialized experience of integrated design in both **public and social healthcare sectors** as well as community facilities.

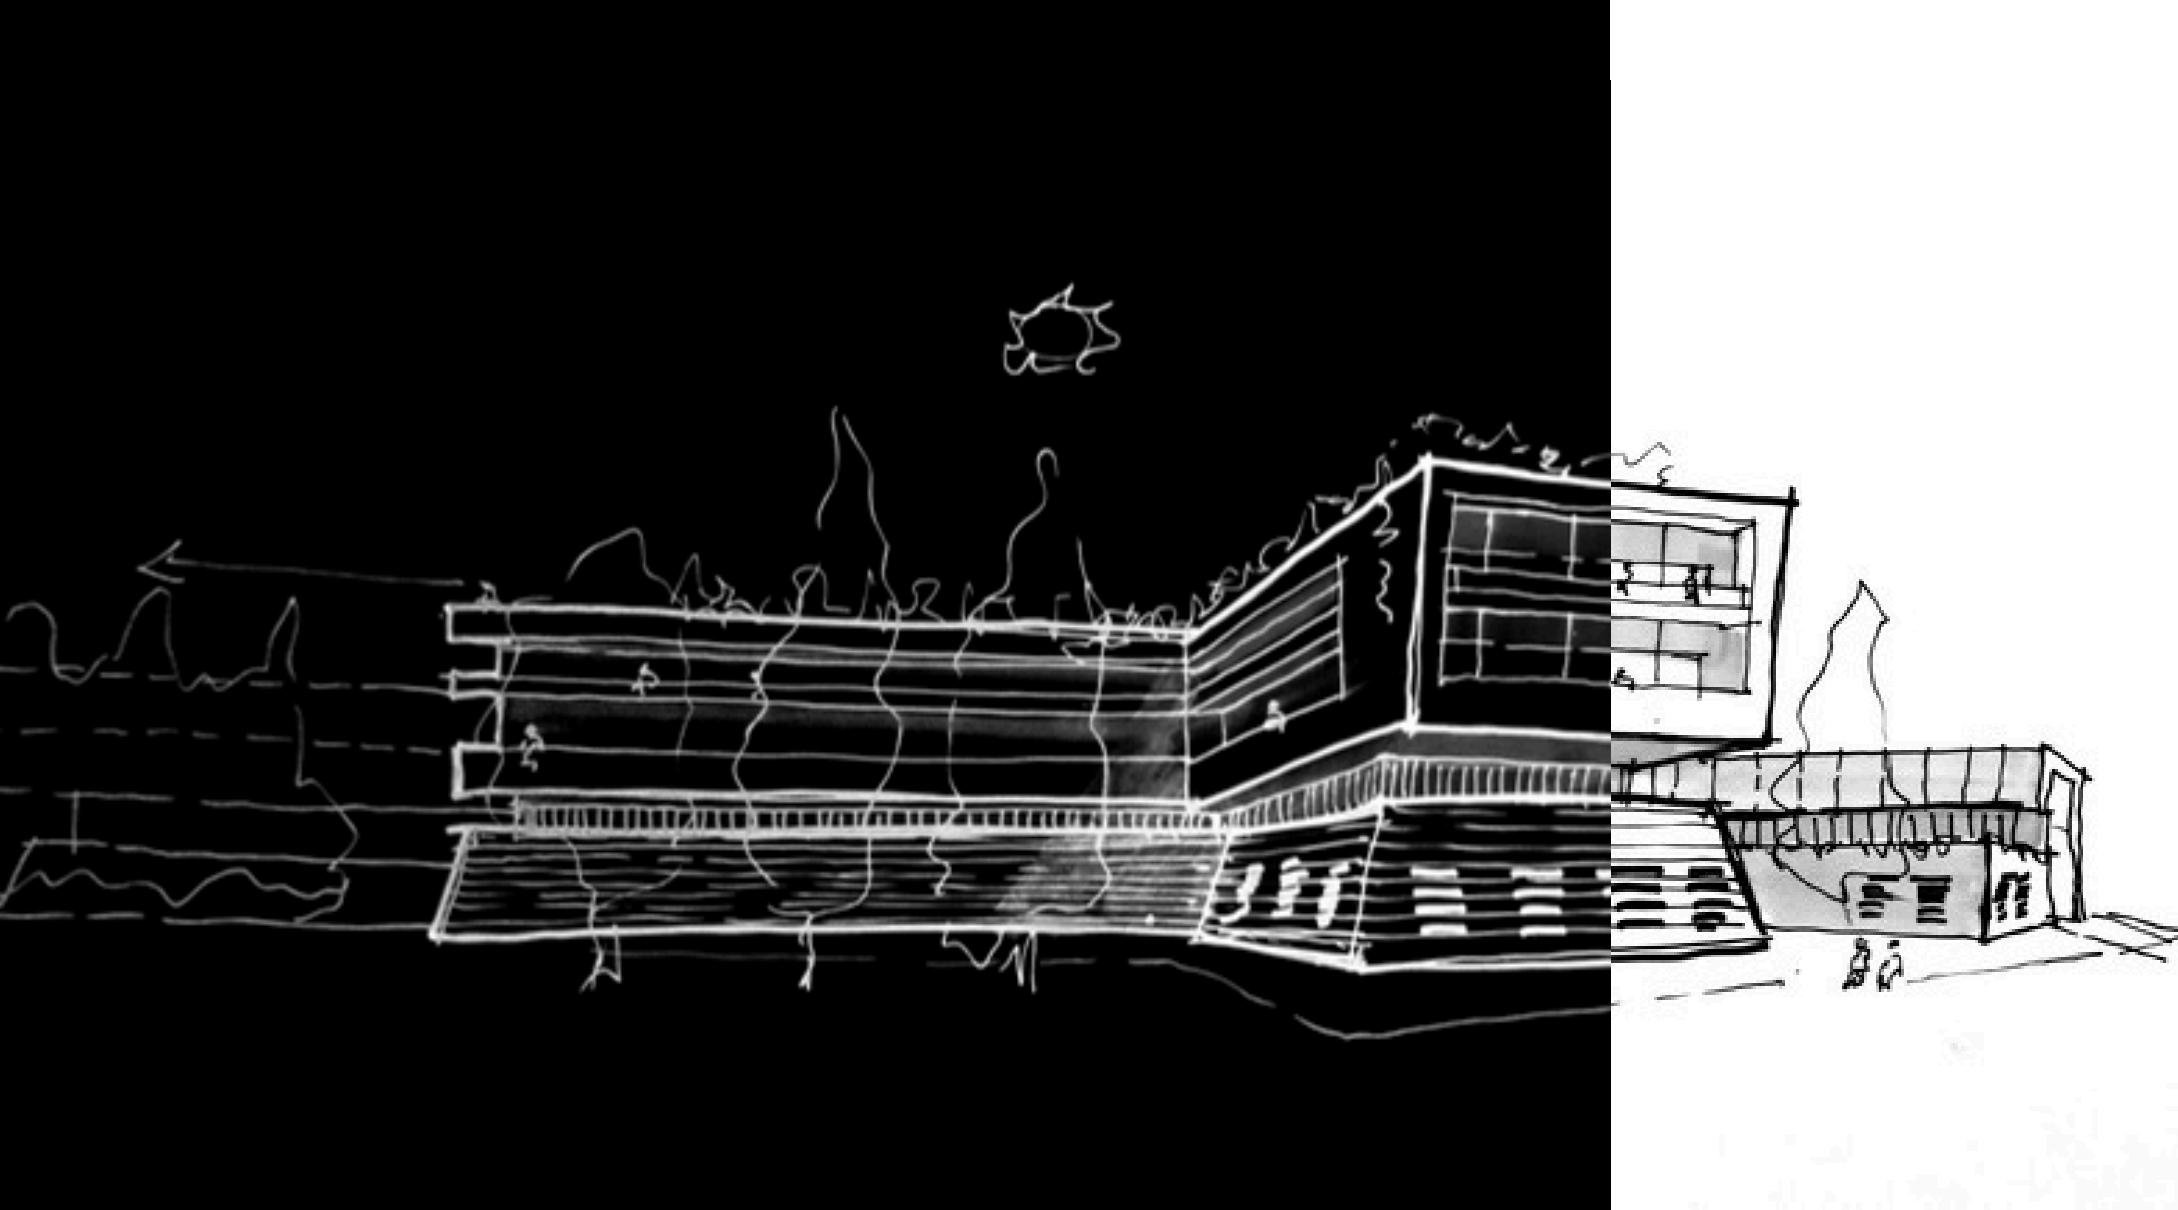

Work in the field of research, design and construction management for the development of **highly complex projects**, coordinating all phases of the conception, implementation and management process, ensuring integration and interoperability with Building Information Modeling approaches.

Thanks to consolidated experience in the management of the entire building process, the group has developed and coordinated **large-scale interventions** which involved both urban and building 'refunctionalizations' and reorganizations and new construction. With a continuous spirit of disciplinary rebuilding, for over thirty years, CSPE's design experiences have arisen from research that combines **innovation and experimentation** with the aim of redefining the relationships between technology, functionality and aesthetics.

Research has characterized the evolution of the studio with a continuous and constant commitment: in the early years, it represented a solid basis for cultural investigation which, in more mature years, found opportunities for verification and interaction with the ever-increasing design opportunities.

Over the years, CSPE, for the quality of its research and achievements, has received **important recognition** from international institutions such as the European Community, the **World Health Organization** and **UNESCO**.

Opera in regime di Qualità secondo la norma ISO 9001:2015 e possiede le certificazioni UNI PDR 74 e ISO 14001

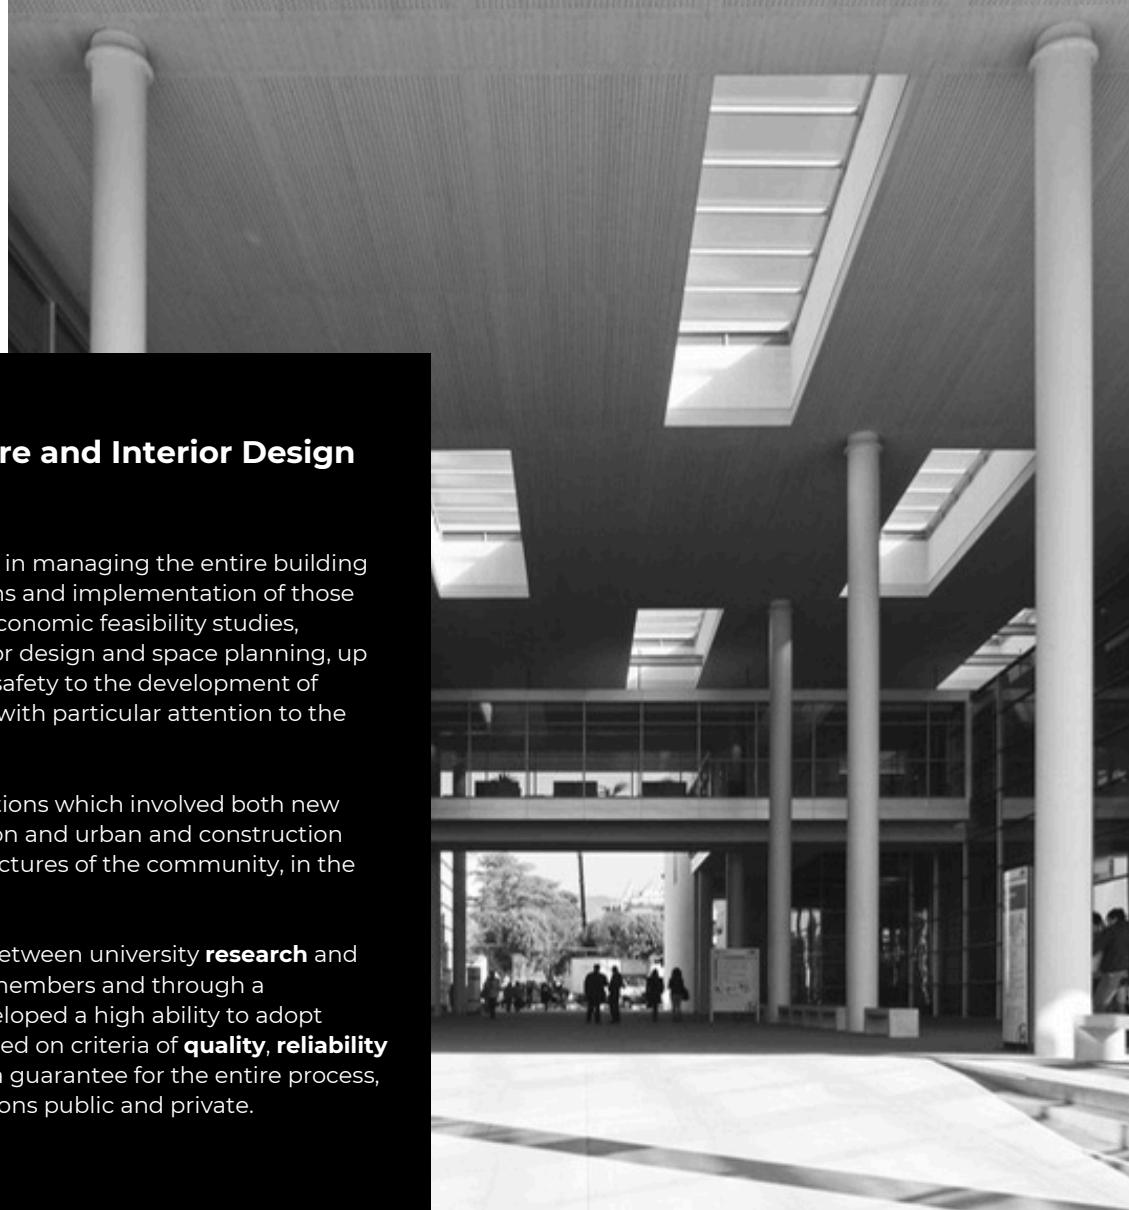

360° DESIGN SERVICES

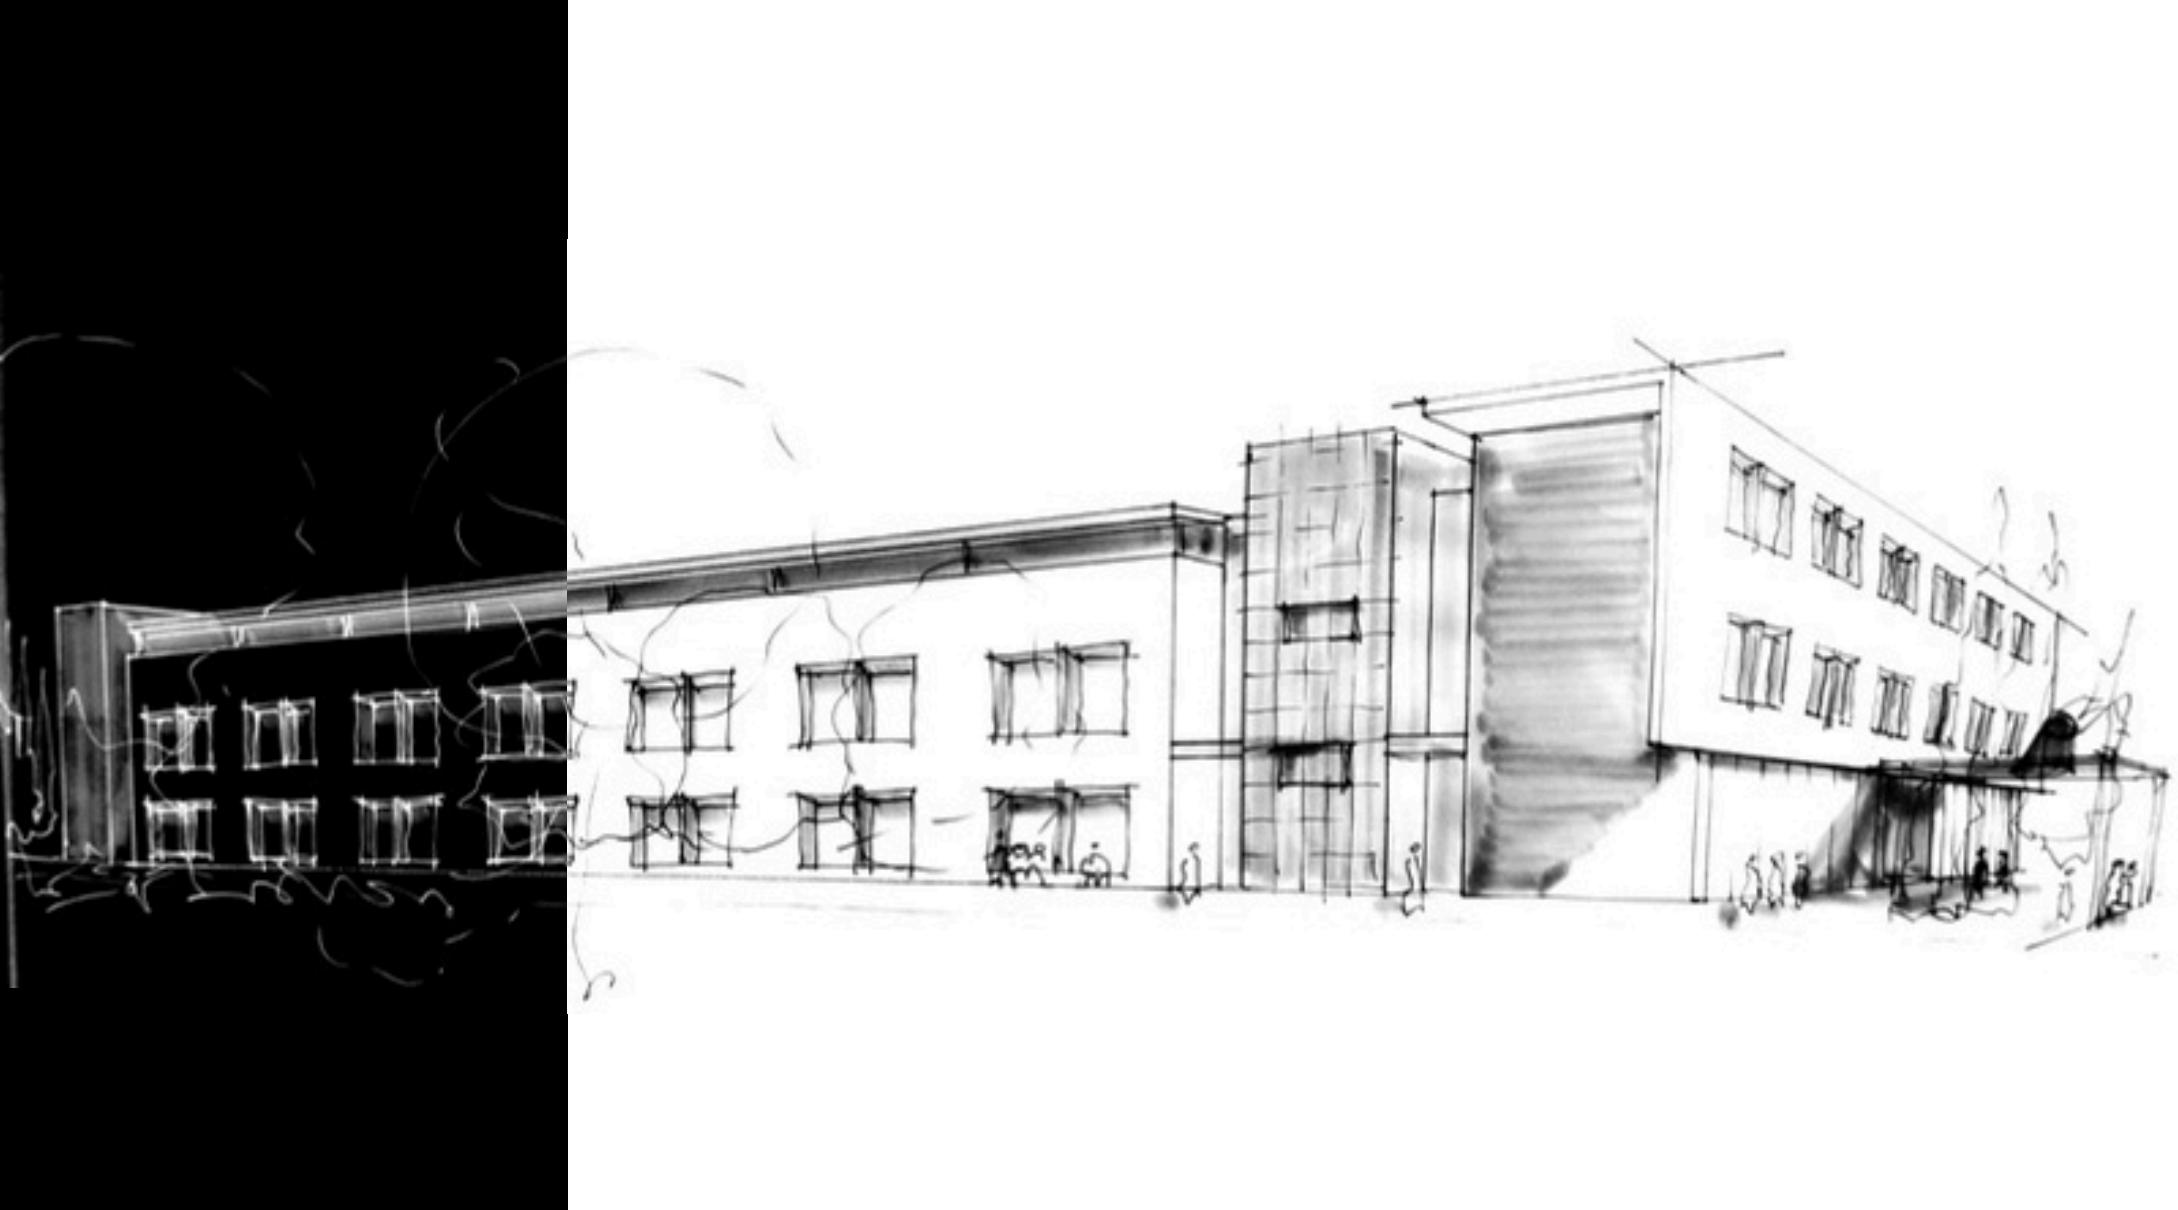

Urban Planning, Architecture and Interior Design

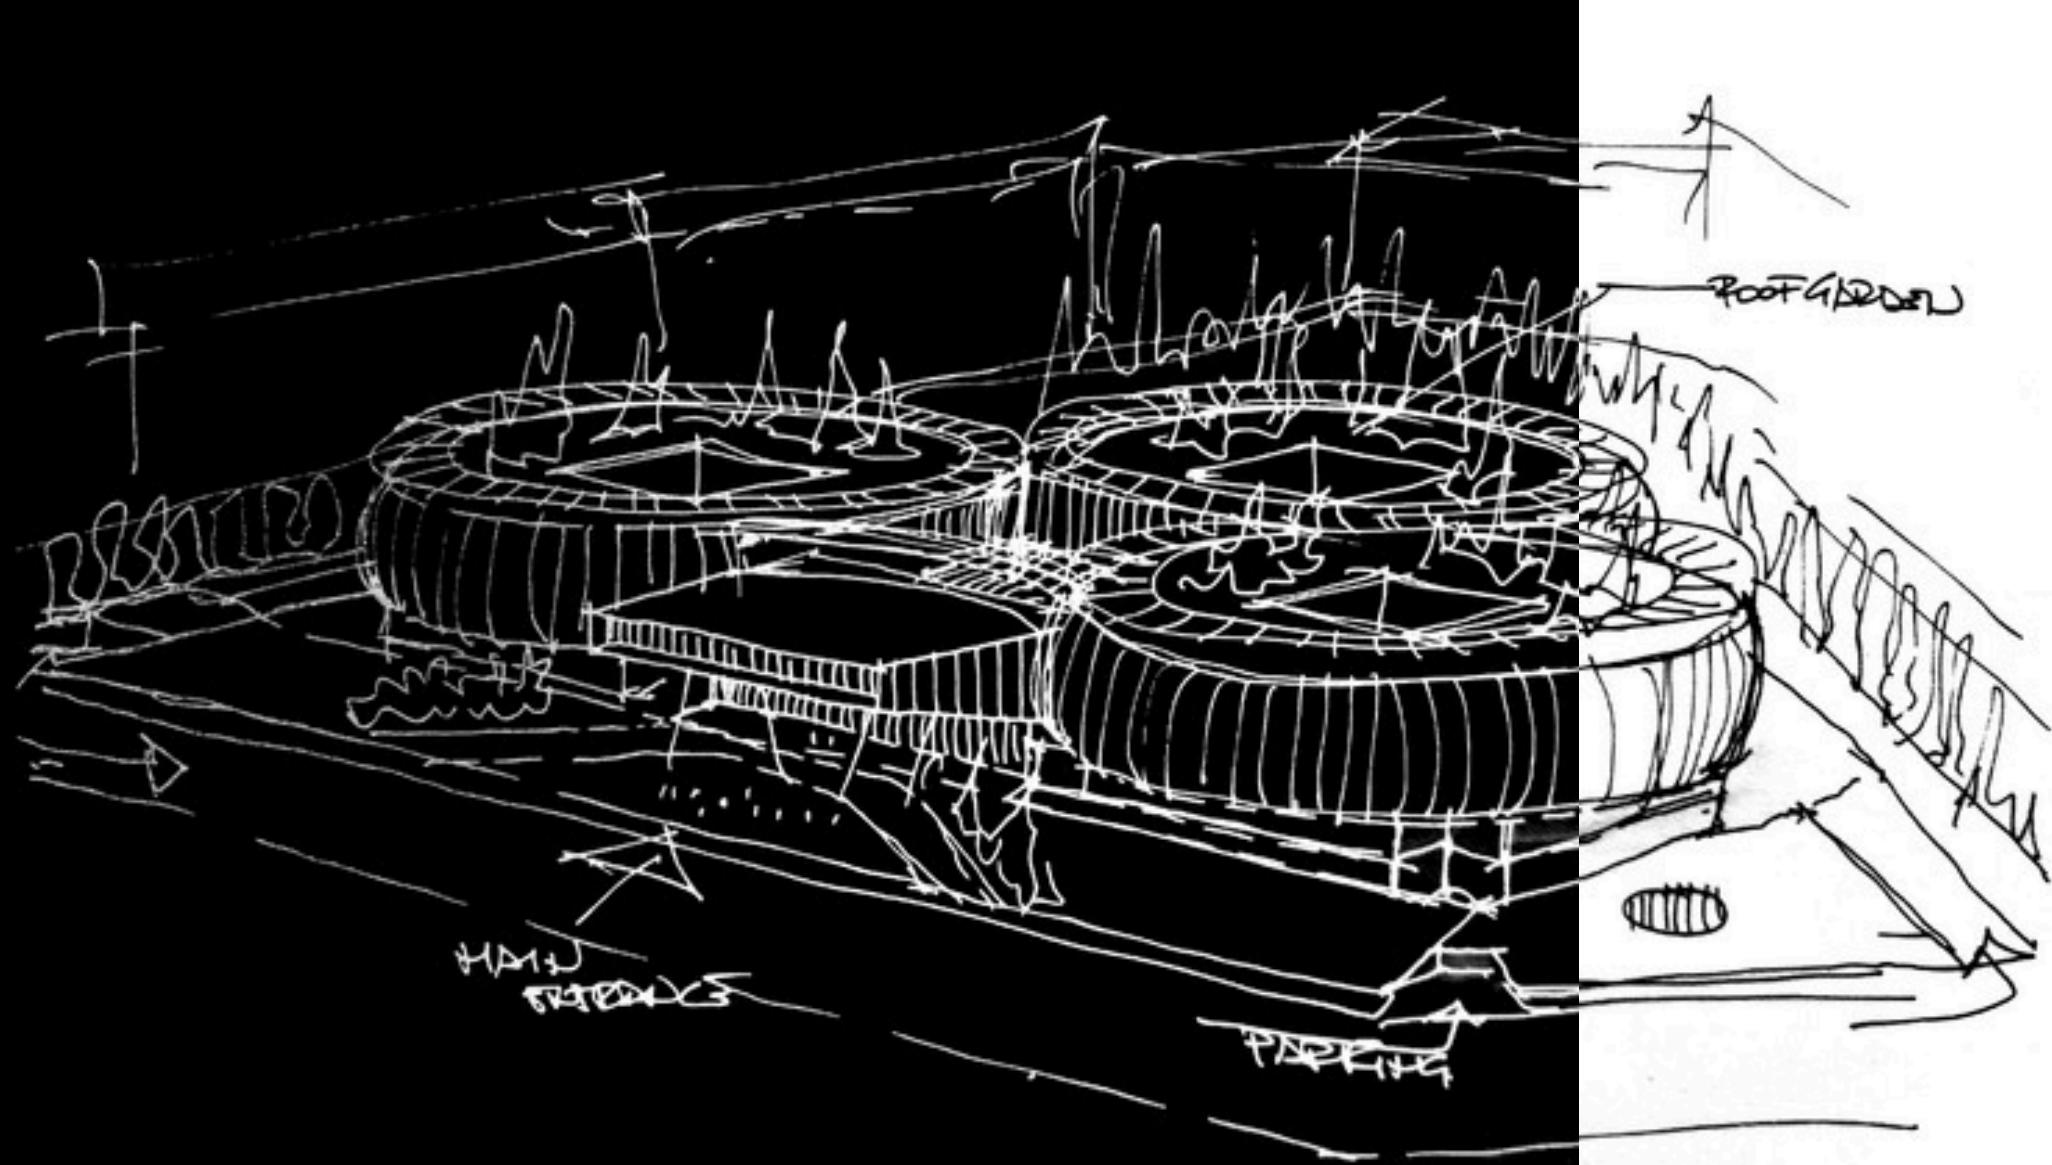

The group has considerable experience in managing the entire building process, from the drafting of urban plans and implementation of those schemes to the composing technical-economic feasibility studies, definitive and executive projects, interior design and space planning, up to construction management and site safety to the development of management and maintenance plans, with particular attention to the **time-cost-quality** relationship.

CSPE has dealt with large-scale renovations which involved both new construction and the re-functionalisation and urban and construction reorganization of service areas and structures of the community, in the health, civic, and education sectors.

Starting from a continuous exchange between university **research** and professional practice developed by its members and through a **multidisciplinary approach**, it has developed a high ability to adopt innovative models and approaches, based on criteria of **quality, reliability** and control of the building process, as a guarantee for the entire process, that facilitates the numerous commissions public and private.

HUMANIZATION AND CENTRALITY OF THE PERSON

The concept of humanization of care spaces has its origins in the transformation of the concept of 'Health'; from the biomedical approach, which focused attention on the treatment of the diseased organ, if progressively moved to a multidimensional approach, that considers well-being of the individual as a whole, as a result of not only clinical, but also functional, emotional, relational, and social needs.

Humanization in healthcare, in a global sense, must be understood as the psycho-sensory interpretation of the needs of the person (patient, family member, or healthcare professional), in reference to the field of medical sciences, communication and architecture, a field in which it creates the interaction between the person and the built environment.

We conceive the project as a continuous critical review of its own models for adopting formal choices with clarity of objectives, attention to functions and dialogues with clients.

"From program to project"

It is with this sensitivity that we place emphasis on the quality control of the entire building process from the preliminary design phase to the complete realization of the work.

HEALTHCARE

The close relationship between hospital, city and territory is a central issue of contemporary design that aims to break the isolation of the places responsible for treatment and consider “the well-being” of the individual in its totality.

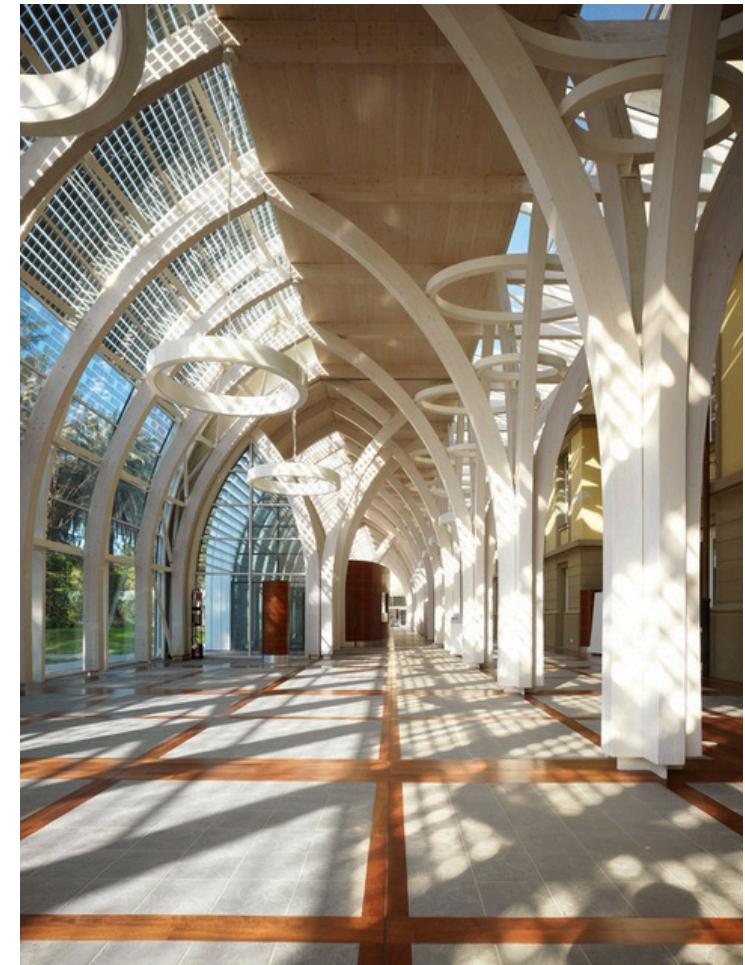

Use of transparent materials, extensive planting of vegetation, and creating areas for collective use as aesthetic elements of the project; to convey an overall perception that is the most possibly detached from the negative stereotype of hospital buildings.

EDUCATION

A school building has always had a strong symbolic value that refers to the history of man, of his ability to construct knowledge: it is a text that transmits a cultural heritage, the image that a company intends to pass onto its heirs. Design today takes on an increasingly fundamental role in the territory where it operates, managing to educate and regenerate urban fabrics, becoming a place open to the community.
